

Java Stream Cheat Sheet (Java 8)

Intermediate Methods (Return Stream)

Method	Description	Example
<code>filter()</code>	Filter elements	<code>filter(x -> x > 5)</code>
<code>map()</code>	Transform elements	<code>map(x -> x * 2)</code>
<code>sorted()</code>	Sort elements	<code>sorted()</code>
<code>distinct()</code>	Remove duplicates	<code>distinct()</code>
<code>limit()</code>	Limit elements	<code>limit(3)</code>
<code>skip()</code>	Skip elements	<code>skip(2)</code>

Terminal Methods (Return Result)

Method	Description	Example
<code>forEach()</code>	Iterate elements	<code>forEach(System.out::println)</code>
<code>collect()</code>	Convert to collection	<code>collect(Collectors.toList())</code>
<code>count()</code>	Count elements	<code>count()</code>
<code>findFirst()</code>	First element	<code>findFirst()</code>
<code>findAny()</code>	Any element	<code>findAny()</code>
<code>anyMatch()</code>	Any match	<code>anyMatch(x -> x > 10)</code>
<code>allMatch()</code>	All match	<code>allMatch(x -> x > 0)</code>
<code>noneMatch()</code>	None match	<code>noneMatch(x -> x < 0)</code>

Key Interview Points

- Streams are lazy (execute only after terminal operation).
- Streams cannot be reused.
- Use `parallelStream()` for parallel processing.
- Stream is not a data structure.
